

Falling short of expectations? Stress-testing the European banking system

Viral V. Acharya and Sascha Steffen

No. 315, 15 January 2014

Introduction

The eurozone is mired in a recession. In 2013, the GDP of all 17 eurozone countries fell by 0.5% and the outlook for 2014 shows considerable risks across the region. To stabilise the common currency area and its (partly insolvent) financial system, a eurozone banking union is being established. An important part of the banking union is the Single Supervisory Mechanism (SSM), which will transfer the oversight of Europe's largest banks to the European Central Bank (ECB). Before the ECB takes over this responsibility, it plans to conduct an Asset Quality Review (AQR) in 2014, which will identify the capital shortfalls of these banks.¹

The banking systems in the eurozone have been severely under-capitalised since the 2007-09 financial crisis. As a result, some banks loaded up on risky assets (and risky sovereign debt in particular). The worsening risk profile of these assets destabilised banks even further and resulted in substantial liquidity and solvency problems by the third quarter of 2011 (Acharya & Steffen, 2013). Insufficient capital in the banking systems appears to have also caused a misallocation of credit in the euro area, especially for small- and medium-sized enterprises (SMEs), preventing a widespread economic recovery.

A comprehensive and decisive AQR will most likely reveal a substantial lack of capital in many peripheral *and* core European banks. This study provides estimates of the capital shortfalls of banks that will be stress-tested under the AQR using publicly available data and a series of shortfall measures. We document which banks will most likely need capital, where a public back stop is likely to be needed, and, as many countries are already highly leveraged, where an EU-wide backstop might be necessary.

Stress Test Sample

The ECB published a (preliminary) list of 124 euro-area banks that will be part of the AQR in 2014 and subject to ECB supervision going forward.² We use a sample of 109 of these banks (41 banks are publicly

¹ The AQR is done together with a stress test and a supervisory assessment. For brevity, we simply use the abbreviation AQR in our analysis.

² A list of these banks is provided in Annex 1.

CEPS Policy Briefs present concise, policy-oriented analyses of topical issues in European affairs, with the aim of interjecting the views of CEPS researchers and associates into the policy-making process in a timely fashion.

Viral V. Acharya is C.V. Starr Professor of Economics, Department of Finance, Stern School of Business, New York University; Research Affiliate of the Centre for Economic Policy Research in London and a Research Associate in Corporate Finance at the National Bureau of Economic Research, Cambridge, MA. Sascha Steffen is Associate Professor, European School of Management and Technology, (ESMT) in Berlin. Unless otherwise indicated, the views expressed are attributable only to the authors in a personal capacity and not to any institution with which they are associated.

listed) where balance sheet information is available using SNL Financial data. We use the most recent data (i.e. as of either December 2012 or June 2013).

Table 1 shows that the banks in our stress tests have €22.9 trillion in total assets (all tables and figures are grouped together at the end of this report). Table 1 also provides an overview of all banks at the country level, showing mean regulatory capital ratios and bank characteristics. There is substantial cross-sectional heterogeneity in terms of risk-weighted assets among European banks, ranging from 24.5% of total assets (France) to more than 77% (Slovenia), with Deutsche Bank AG (the largest bank in the stress test) reporting that almost 84% of its assets are “riskless” (Table 2 and Annex 1). Furthermore, the average market-to-book ratio of 0.66 suggests that the market is heavily discounting banks’ assets portfolios (Table 3), at least in part due to the relatively high risk of some of the ‘riskless’ assets relative to the markdowns taken by banks on these assets against their book equity values.

Unstressed capital shortfall measures

The four book capital ratios we employ are: 1) Core Tier 1 ratio (C Tier 1), which is core Tier 1 capital divided by risk weighted assets (RWA); 2) book equity divided by total assets (equity/assets); 3) tangible equity/tangible assets, which is book equity less intangible assets divided by total assets less intangibles assets; and 4) the International Financial Reporting Standards (IFRS) Tier 1 LVG ratio, which is C Tier 1 capital divided by tangible assets minus derivative liabilities.³

Our unstressed measures calculate capital shortfall as the gap of the current book capital measure relative to thresholds: 1) the C Tier 1 ratio relative to an 8% threshold as in the AQR⁴, 2) the equity/asset ratio relative to a 3% threshold, 3) the tangible equity/tangible asset ratio relative to a 3% threshold and 4) the IFRS Tier 1 LVG ratio relative to a 3% threshold. These measures are unstressed in that they are capital requirements without accounting for potential losses in future stress scenarios.

Using the four book capital measures and the unstressed thresholds mentioned above, we identify a capital shortfall of between €7.5 billion (using the C Tier 1 ratio and the AQR 8% threshold) and €66.8 billion (using the tangible equity/tangible asset ratio and a 3% threshold) even in the unstressed case (Table 2).

Stressed capital shortfall measures

To account for potential losses in future stress scenarios, we employ four stressed capital shortfall measures. The first two measures raise the level of capital requirements, while the remaining two measures (also) account for losses:

1. **Book capital shortfall.** Using book values of equity and assets, the less-stringent benchmark is a leverage ratio (book equity/assets) of 4% and the more stringent benchmark is a 7% leverage ratio. Haldane & Madouros (2012) reports that a 4% capital ratio (7% for the largest financial institutions) would have been necessary to guard against bank failure during the recent financial crisis.
2. **Market capital shortfall.** Similarly, using the market value of equity and assets, the less stringent benchmark is a leverage ratio (market equity/assets) of 4% and the more stringent benchmark is a 7% leverage ratio.
3. **SRISK or capital shortfall in a systemic crisis.** We assume a systemic financial crisis with a global stock market decline of 40%. SRISK 5.5% VLAB is our measure for a bank’s capital shortfall in this scenario, assuming a 5.5% prudential capital ratio with losses estimated using the VLAB

³ This ratio accounts for the fact that IFRS – in contrast to the generally accepted accounting principles (GAAP) in the US – does not allow netting of derivative securities. This measure of assets is thus most comparable to US financial institutions.

⁴ The AQR threshold of 8% is comprised of a 4.5% core Tier 1 ratio, a 2.5% capital conservation buffer and a 1% surcharge at systemically relevant institutions.

methodology to estimate the downside risk of bank stock returns.⁵ While this scenario and the resulting SRISK measure uses market data and market equity (instead of book equity) in determining leverage, the approach is conceptually similar to that of the EU stress tests, which is to estimate losses in a stress scenario and determine the capital shortfall between a prudential capital requirement and the remaining equity after losses.

4. **Capital shortfall after write-down.** We assume that banks have to write down their entire non-performing loan portfolio net of reserves during a severe financial crisis. We account for this write-down when calculating the capital shortfall of the banks using our four book capital measures (which are adjusted for the write-downs) and comparing them to a threshold of 4%. This shortfall measure is motivated by theory that suggests that under-capitalised banks continue to provide funding to unhealthy borrowers to prevent a write-down of their loans ('zombie lending') and that a forced write-down can ameliorate the zombie lending problem.

Main results on stressed capital shortfall estimates

1. The book capital shortfall estimates indicate a capital shortfall for all banks of between €82 billion and €176 billion (4% benchmark capital ratio) or between €509 billion and €767 billion (7% capital ratio – see Table 4 and Figure 1).
2. The market capital shortfall estimates indicate a capital shortfall of €230 billion (4% benchmark capital ratio) or €620 billion (7% capital ratio) for the 41 publicly listed banks (see Table 5 and Figure 2).
3. Estimates of SRISK or the capital shortfall in a systemic financial crisis (40% market decline over a six-month period) is €579 billion; 41% is due to downside correlation with the market, while 59% is due to the leverage of these institutions (Table 6).
4. Capital shortfall estimates when writing down their net non-performing loan portfolios range from €232 billion (using the C Tier 1 ratio and an 8% threshold as in the AQR) and €435 billion (using the tangible equity/tangible assets ratio and a 4% threshold) (Table 7).
5. There is a high rank correlation between the shortfalls based on book and market capital ratio measures. However, we find *no* significant correlation between shortfalls calculated using regulatory (i.e. risk-weighted asset-based) capital ratios and shortfalls calculated under market or book capital ratios. Similar to Acharya et al. (2013), this highlights how flawed risk-weighted asset-based measures can be (Table 8 and Figure 3). This is a significant operational risk in that even a well-intentioned AQR can underestimate the true capital shortfall of the banking sector by not addressing the problem of static and out-of-date risk weights, especially for risky sovereign bonds.
6. Cross-country variations in our capital shortfall estimates indicate that:
 - a. French banks are leading each book and market capital shortfall measure, both in absolute euro amounts and relative to its GDP. The capital shortfall ranges from €31 billion (using the equity/asset ratio and a 4% threshold) to €285 billion (using the tangible equity/tangible asset ratio and a 7% threshold) (Table 3). The SRISK stress scenario suggests a shortfall of €222 billion, which corresponds to almost 13% of the country's GDP (Table 6).

⁵ This capital shortfall measure has been implemented based on Acharya et al. (2012) and Brownlees & Engle (2013). The data are provided by New York University's VLAB (<http://vlab.stern.nyu.edu/welcome/risk/>). The theoretical motivation for the measure can be found in Acharya et al. (2010). SRISK has been documented to be a comprehensive measure that includes losses due to both a bank's investments in assets and its exposure to fragile liabilities, which in the current European context relate, respectively, to holdings of peripheral sovereign bonds and (short-term) funding risk such as US money market fund withdrawals and other wholesale investors (Figure 5).

- b. German banks are a close second, although they benefit from a stronger domestic economy with a higher GDP and capacity for public backstops (Table 6 and Figure 4).
 - c. Spanish and Italian banks appear to have large capital shortfalls when non-performing assets are fully written down. Both countries account for about a third of the total shortfall after write-downs (Table 7). Market-based measures such as SRISK amount to about 6.5%–7.6% of the GDP of both countries (Table 6).
7. The capital shortfalls are large as a multiple of the banks' market value of equity. In particular, assuming a 4% stressed capital ratio and impairment of the non-performing loan portfolio (Table 9), they range from multiples of 1.4 (IFRS Tier 1 LVG ratio) to 18.2 (SRISK). The market value of equity reflects the maximum amount of capital a bank can raise today in private markets based on the current market valuation of the firm. If we add subordinated debt as the next group of creditors that is going to be bailed-in, the shortfalls still range as a multiple of the banks' market value of equity and subordinated debt (Table 9 and Figure 5) from 0.9 (IFRS Tier 1 LVG ratio) to 1.5 (SRISK).
- d. Banks in Belgium, Cyprus and Greece are leading the group of banks with the largest capital shortfall estimates, with shortfalls as a multiple of the banks' market value of equity and subordinated debt up to 11 (Belgium, SRISK).
 - e. France and Germany are among the five countries with the largest capital shortfall estimates for their banks. The shortfall estimates range as a multiple of the banks' market value of equity and subordinated debt from 0.3 (Germany, IFRS Tier 1 LVG ratio) to 1.1 (France, SRISK).
 - f. Capital shortfalls for Italian and Spanish banks range as a multiple of the banks' market value of equity and subordinated debt from 0.1 for Spain (market equity/assets) to 0.91 for Italy (tangible equity/tangible assets).

Implications

As portfolio (micro-level) data of banks' individual exposures are not publicly available, our estimates of capital shortfalls employ publicly available book capital and market data and are based on empirical evidence and theory. We believe these estimates provide an interesting benchmark against which the AQR stress tests should be evaluated.

Our results suggest that with common equity issuance (e.g. through deep-discount rights issues) and haircuts on subordinated creditors (e.g. through bail-ins), it should be possible to deal with many banks' capital needs. Some will, however, require public backstops, especially if bail-ins are difficult to implement without imposing losses on bondholders, who may themselves be other banks and systemically important financial institutions. The banking sectors in Belgium, Cyprus and Greece seem likely to require backstops.

Our results also suggest large shortfalls in core European countries such as France and Germany. Germany has many government-owned institutions that may require capital issuances and/or bail-ins. Interestingly, market measures of equity imply significantly greater capital shortfalls for France and Germany than do the book measures. Moreover, while Italy's capital shortfalls are much higher relative to the market value of equity than Spain's, the two look similar when allowing for bail-ins on subordinated debt, due to greater subordinated bond holdings of Italian banks.

National governments might be inclined to influence the design of the AQR to prevent these banks from being singled out in the stress tests. This raises the difficult question as to whether the AQR will eventually live up to expectations and restore confidence and creditability in the ECB as a single supervisor. Objective capital shortfall estimates such as ours can provide a valuable defence mechanism against any such political efforts to blunt the effectiveness of the proposed AQR and the intended recapitalisation of the euro-area banking system.

It should be noted that on 18 December 2013, the EU finance ministers agreed to set up a common resolution fund of €55 billion financed through contributions of banks. This fund becomes fully operational after 10 years and is supposed to pay for the restructuring or resolution of failing banks after bank shareholders and creditors have been bailed in. Our results suggest that these funds might be insufficient in a severe financial crisis and public back-stops, e.g. through the European Stability Mechanism (ESM), might still be necessary.

Figure 1. Capital shortfall using stressed book capital measures

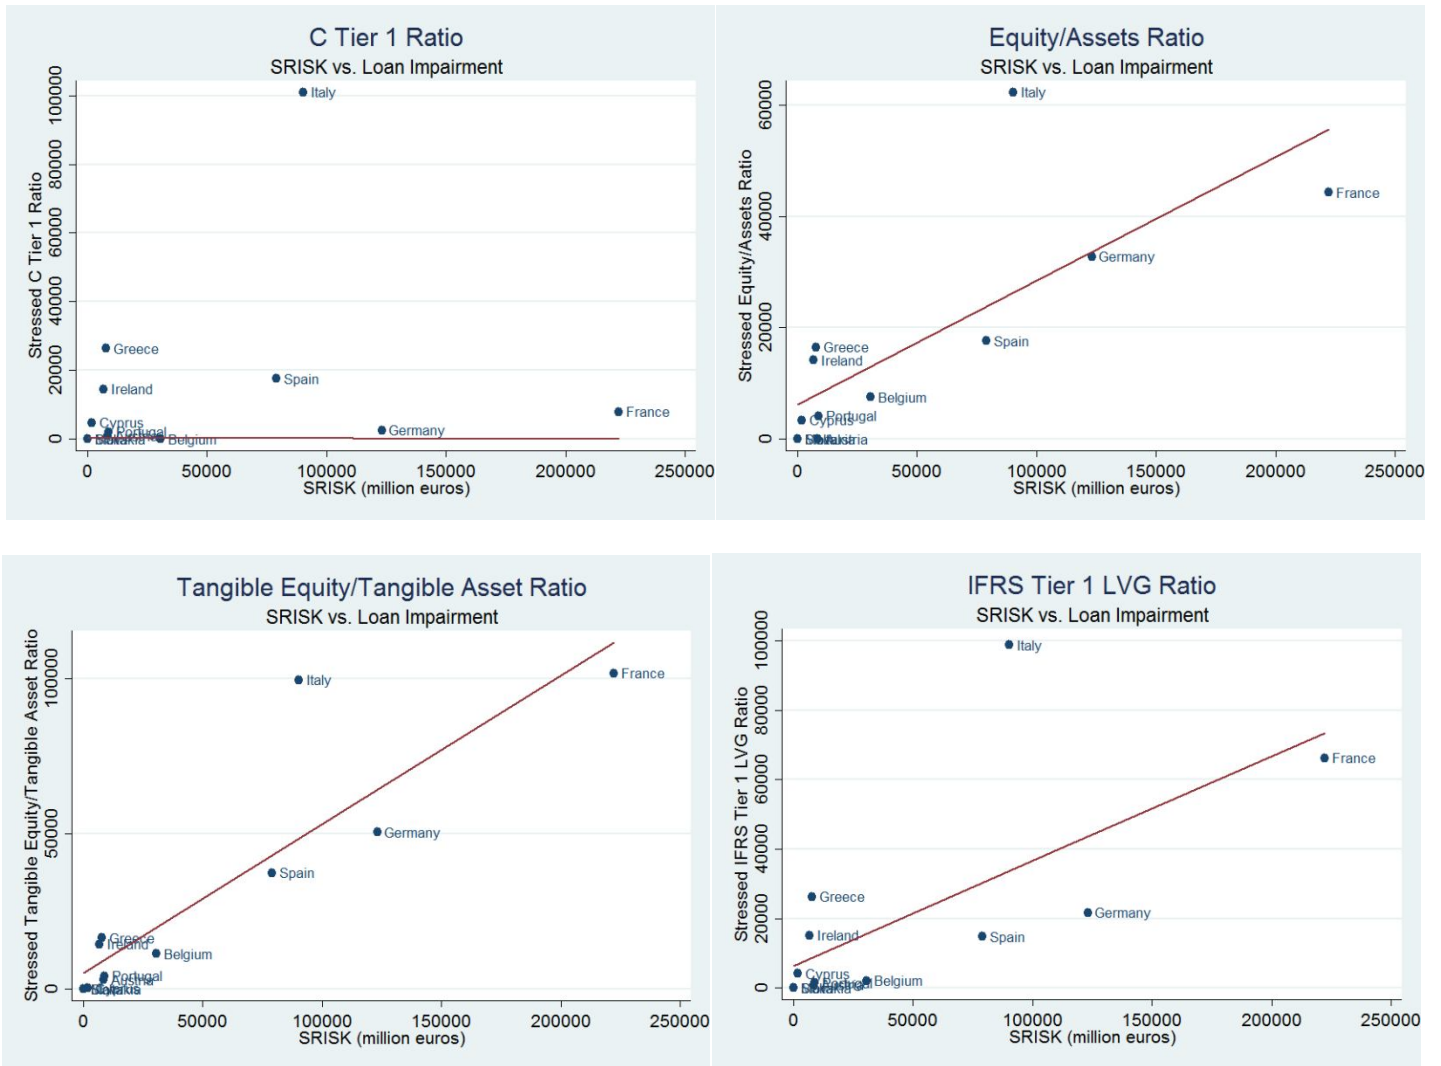

Figure 2. Capital shortfall using stressed market capital measures

Notes: This figure shows the banks' capital shortfall using two stressed market-based measures: 1) SRISK is the shortfall in case of an aggregate market decline of 40%, assuming a prudential capital ratio of 5.5% and 2) a market leverage ratio (market equity/assets) and a threshold of 7%. Market equity/assets is calculated as market equity divided by assets minus book equity plus market equity. Countries with zero shortfall under the respective measure are omitted.

Figure 3. Correlation of capital shortfalls

Notes: This figure shows the correlation of banks' capital shortfall assuming that banks need to write down their net non-performing loans ('loan impairment') and SRISK. C Tier 1 is the Common Tier 1 ratio and defined as Common Tier 1 capital over risk-weighted assets (RWA). Equity/Assets is book equity over total assets. IFRS Tier 1 LVG is C Tier 1 capital divided by total assets minus intangible assets minus derivative liabilities. Tangible equity/tangible assets is book equity minus intangible assets divided by total assets minus intangible assets. SRISK is the shortfall in case of an aggregate market decline of 40% assuming a prudential capital ratio of 5.5%. Shortfalls are reported in millions of euros and are summed over all banks in each country.

Figure 4. Capital shortfall using stressed market capital measures (scaled by GDP and market equity)

Notes: This figure shows the banks' capital shortfall using stressed market-based measures. SRISK is the shortfall in case of an aggregate market decline of 40%, assuming a prudential capital ratio of 5.5%. The shortfall is scaled by the country's GDP and the banks' total capitalisation. Countries with zero shortfall under the respective measure are omitted.

Figure 5. Shortfalls relative to market equity and subordinated debt

Notes: This figure shows the banks' capital shortfall relative to market equity plus subordinated debt (including hybrid capital) using stressed book-and market-based measures and incorporating a full write-down of the non-performing loan portfolios. For all measures, we assume a 4% target capital threshold. SRISK is the shortfall in case of an aggregate market decline of 40%, assuming a prudential capital ratio of 4%. Market equity/Assets is market equity divided by asset minus book equity plus market equity. Equity/Assets is book equity divided by total assets. IFRS Tier 1 LVG is C Tier 1 capital divided by total assets minus intangible assets minus derivative liabilities. Countries with no capital shortfall are omitted.

Notes: This table reports descriptive statistics of the banks included in the Asset Quality Review conducted by the ECB in 2014 (data are available for 109 out of the 128 banks included in the AQR). C Tier 1 is the Common Tier 1 ratio and is Common Tier 1 Capital divided by Risk-Weighted Assets. Equity/Assets is book equity over total assets. IFRS Tier 1 LVG is C Tier 1 Capital divided by total assets minus intangible assets minus derivative liabilities. Tangible equity/Tangible assets is defined as book equity minus intangible assets divided by total assets minus intangible assets. RWA/Assets is RWA divided by total assets. Net impaired loans/C Tier 1 capital is the amount of impaired loans net of reserves over Common Tier 1 Capital. Assets are total assets and measured in millions of euros. Banks are the number of banks per country that are included in the AQR and for which data are available. Data are from H1 2013 if available or EOY 2012.

Total	22,920,400	7,553	19,082	66,777	32,589

Notes: This table reports the banks' capital shortfall using unstressed capital shortfall measures. The 8% C Tier 1 threshold is used in the AQR. We assume a benchmark capital ratio for other book measures of leverage of 3%. C Tier 1 is the Common Tier 1 ratio and is Common Tier 1 Capital over Risk-Weighted Assets (RWA). Equity/Assets is book equity divided by total assets. Tangible equity/Tangible assets is book equity minus intangible assets divided by total assets minus intangible assets. IFRS Tier 1 LVG is C Tier 1 capital divided by total assets minus intangible assets minus derivative liabilities. Assets are total assets and measured in millions of euros. Shortfalls are reported in millions of euros and are summed over all banks in each country.

Table 3. Descriptive statistics: Market capitalisation

Notes: This table reports summary statistics of market-based measures of capitalisation on a country level. MES is the co-movement of the banks' stock return with the market index in a financial crisis over a one-day period. Variance is the daily variance of the equity return. Beta is the beta of the firm with respect to the MSCI World Index. Correlation is correlation of the firm with respect to the MSCI World Index. Market-to-Book is market value over book value of equity as of 30 June 2013. Market equity/Assets is a market leverage ratio and defined as market equity divided by asset minus book equity plus market equity. Assets are total assets and measured in millions of euros. Market cap is the market value of equity on June 30, 2013 measured in millions of euros. Banks are the number of public banks in each country.

Notes: This table reports the banks' capital shortfall under stressed book capital measures. We assume a benchmark capital ratio for other book measures of leverage of 4% as well as 7%. C Tier 1 is the common Tier 1 ratio and defined as common Tier 1 capital over risk-weighted assets (RWA). Equity/Assets is book equity divided by total assets. Tangible equity/Tangible assets is book equity minus intangible assets divided by total assets minus intangible assets. IFRS Tier 1 LVG is C Tier 1 capital divided by total assets minus intangible assets minus derivative liabilities. Assets are total assets and measured in millions of euros. Shortfalls are reported in millions of euros and are summed over all banks in each country.

Table 5. Book capital vs. market capital based measures (€ mil.)

Country	Book capital ratio stress test			Market capital ratio stress test		
	Equity/Assets	Equity/Assets	Equity/Assets	Market equity/Assets	Market equity/Assets	Market equity/Assets
Benchmark	3%	4%	7%	3%	4%	7%
France	7,883	25,732	150,117	57,491	106,494	253,504
Germany	0	18,660	94,784	37,017	62,929	140,665
Spain	0	653	17,860	3,554	9,768	70,401
Italy	0	1,963	8,907	13,665	34,265	103,192

Total	12,335	54,242	294,661	122,224	230,587	619,856

Notes: This table reports the banks' capital shortfall using stressed book and market measures. Equity/Assets is book equity over total assets. Market equity/Assets is a market leverage ratio and defined as market equity over assets minus book equity + market equity. The less stringent benchmark is a leverage ratio of 4% and the more stringent benchmark is a 7% ratio. For comparison, we report the shortfall using the unstressed capital ratios (Equity/Assets and Market equity/Assets) of 3%. Shortfalls are reported in millions of euros and are summed over all banks in each country.

Table 6. SRISK or capital shortfall in a systemic crisis

Panel A: Absolute SRISK

Country	Market Capital (€ mil.)	Market equity/ Assets	LRMES	LRMES* Market equity (€ mil.)	SRISK	SRISK (€ mil.)	SRISK	SRISK
					5.50% VLAB	Prudential capital ratio

Total	381,692	4.43%	36.53%	3.82%	5.88%	2.29%	3.69%	8.07%

Notes: This table reports European banks' capital shortfall if there is a systemic crisis (defined as a 40% drop in the market index over a six-month period). Market equity is the total market capitalisation of publicly listed AQR banks as of 30 June 2013 in millions of euros. Market equity/Total assets is market capitalisation over total assets. LRMES is the long-run marginal expected shortfall, which is the percentage loss in market capitalization in a systemic crisis over a 6-month period. LRMES*Market equity is the absolute market value loss in a systemic financial crisis in millions of euros. SRISK is the expected shortfall of a bank in a systemic crisis over a six-month period considering both LRMES and LVG. SRISK 5.5% VLAB is SRISK calculated assuming a 5.5% prudential capital ratio (which is the measure available on the NYU Stern Volatility Lab website). SRISK 3%, 4% and 7% are capital shortfall estimates in a systemic crisis under different prudential capital ratio assumptions. Panel A reports the absolute shortfalls in millions of euros for each country sorted by the largest absolute SRISK 5.5% VLAB value (in bold). Panel B reports the shortfalls scaled by each country's GDP and sorted by the highest relative SRISK.

Table 7. Write-down of non-performing loan portfolio (€ mil.)

Country	C Tier 1	Equity/Assets	Tangible equity/ Tangible assets	IFRS Tier 1 LVG	Assets
Threshold	8%	4%	4%	4%	
	AQR				
France	8,872	50,232	118,945	86,934	7,136,917

Slovenia	3,738	3,165	3,194	3,316	19,042
Malta	114	0	24	123	12,965
Estonia	0	0	0	0	12,914
Latvia	0	0	0	0	11,796
	232,204	272,720	435,310	334,641	22,920,400

Notes: This table reports the banks' capital shortfall assuming that banks need to write down their net impaired loans. The 8% C Tier 1 scenario as used in the AQR remains unchanged. C Tier 1 is the Common Tier 1 ratio and defined as Common Tier 1 capital over risk-weighted assets (RWA). Equity/Assets is book equity over total assets. Tangible equity/Tangible assets is defined as book equity minus intangible assets over total assets minus intangible assets. IFRS Tier 1 LVG is C Tier 1 Capital over total assets minus intangible assets minus derivative liabilities. We assume a capital threshold of 4% for the Equity/Assets, Tangible equity/Assets and IFRS Tier 1 LVG ratios. Shortfalls are reported in millions of euros and are summed over all banks in each country.

Table 8. Rank-Correlation

Panel A: Rank-correlation: Shortfalls using book capital stressed measures of 7% and SRISK

	SRISK	SRISK	SRISK	SRISK
C Tier 1	-0.147			
Equity/Assets		0.916***		
Tangible Equity/Tangible Assets			0.993***	
IFRS Tier 1 LVG				0.795***

Panel B: Rank-correlation: Shortfall using book capital stressed measured after write-down of non-performing loans and a 4% threshold SRISK

	SRISK	SRISK	SRISK	SRISK
C Tier 1	0.409			
Equity/Assets		0.825***		
Tangible equity/Tangible assets			0.888***	
IFRS Tier 1 LVG				0.684**

Panel C: Rank-correlation of stressed book capital shortfall measures

	C Tier 1	Equity/Assets	Impaired loans tangible equity/ Tangible assets	IFRS Tier 1 LVG
% Capital Ratio				
C Tier 1	0.536	0.324	0.395	0.596*
Equity/Assets		0.755**		
Tangible equity/ Tangible assets			0.874**	
IFRS Tier 1 LVG				0.826**

Notes: This table reports the rank-correlation between the shortfalls based on book and market capital ratio measures. Panel A reports the results by computing the rank-correlation between the capital shortfall under stressed book capital measures using a 7% threshold and SRISK. Panel B reports the results computing the rank-correlation between the shortfalls after write-down of the non-performing loan portfolios and SRISK. Panel C reports the results computing the rank-correlation between the shortfalls using a stressed book capital measure of 7% ("7% Capital ratio") and assuming that banks need to write down their net impaired loans and a 4% target capital threshold of 4% ("Impaired loans"). **, * indicate significance levels at 1% and 5%, respectively.

Table 9. Shortfall and 'bail-ins'

Panel A: Shortfalls relative to market equity

Shortfall assuming a 4% threshold (relative to market equity)						
Country	SRISK	Market equity/ Assets	Equity/ Assets	Tangible equity/ Tangible assets	IFRS Tier 1 LVG	
Belgium	20844.0%	12520.9%	9209.9%	9692.0%		8.8%
Cyprus	301.6%	255.6%	769.2%	92.1%		928.3%
France	221.7%	173.4%	86.3%	163.8%		110.1%
Germany	206.8%	157.9%	83.1%	125.8%		56.1%
Portugal	150.0%	124.4%	220.5%	218.9%		75.0%

Austria	60.4%	4.4%	0.0%	37.5%		10.4%
Spain	48.7%	16.5%	29.9%	51.8%		27.1%
Ireland	43.1%	18.1%	81.5%	82.3%		88.0%
Greece	14.7%	0.0%	98.3%	98.0%		157.6%
Malta	0.0%	0.0%	0.0%	0.0%		0.0%
Slovakia	0.0%	0.0%	0.0%	0.0%		0.0%
Total	1834.5%	1112.8%	896.1%	900.5%		141.3%

Panel B: Shortfalls relative to market equity plus subordinated debt

Shortfall assuming a 4% threshold (relative to market equity + subordinated debt)						
Country	SRISK	Market equity/ Assets	Equity/ Assets	Tangible equity/ Tangible assets	IFRS Tier 1 LVG	
Belgium	1124.9%	669.4%	493.0%	527.4%		5.6%
Cyprus	185.0%	156.4%	517.5%	16.0%		636.0%
France	111.4%	82.1%	35.6%	77.2%		51.5%
Germany	110.2%	82.4%	42.9%	66.2%		28.0%
Portugal	63.4%	54.1%	65.6%	65.1%		22.3%
Italy	51.3%	31.3%	58.1%	91.0%		90.1%
Spain	39.8%	14.4%	25.6%	42.4%		23.9%
Austria	36.4%	2.3%	0.0%	22.9%		6.4%
Ireland	31.6%	13.3%	62.8%	63.4%		67.8%
Greece	14.5%	0.0%	94.6%	94.3%		151.6%
Malta	0.0%	0.0%	0.0%	0.0%		0.0%
Slovakia	0.0%	0.0%	0.0%	0.0%		0.0%
Total	147.4%	92.1%	116.3%	88.8%		90.3%

Notes: This table reports the banks' capital shortfall relative to market equity (Panel A) and market equity plus subordinated debt (Panel B), assuming that banks need to write-down their net impaired loans and a 4% capital threshold for each measure. SRISK is the shortfall in case of an aggregate market decline of 40%, assuming a prudential capital ratio of 4%. Market Equity/Assets is defined as market equity over asset minus book equity + market equity. Equity/Assets is book equity over total assets. Tangible equity/Tangible assets is defined as book equity minus intangible assets over total assets minus intangible assets. IFRS Tier 1 LVG is C Tier 1 capital over total assets minus intangible assets minus derivative liabilities.

Annex 2. Correlation of capital shortfalls (by banks)

Notes: These figures show the correlation of banks' capital shortfall assuming that banks need to write-down their net non-performing loans ("Loan Impairment") and SRISK. C Tier 1 is the Common Tier 1 ratio and defined as common Tier 1 capital over risk-weighted assets (RWA). Equity/Assets is book equity divided by total assets. IFRS Tier 1 LVG is C Tier 1 capital divided by total assets minus intangible assets minus derivative liabilities. Tangible equity/Tangible assets is book equity minus intangible assets divided by total assets minus intangible assets. Shortfalls are reported for each publicly listed bank.

Annex 3. Ranking of the public banks by country, sorted by their systemic expected capital shortfall

Institution	Country	Ticker	Market equity (€ mil.)	Market equity/ Assets	SRISK

ABOUT CEPS

Founded in Brussels in 1983, the Centre for European Policy Studies (CEPS) is widely recognised as the most experienced and authoritative think tank operating in the European Union today. CEPS acts as a leading forum for debate on EU affairs, distinguished by its strong in-house research capacity, complemented by an extensive network of partner institutes throughout the world.

Goals

- Carry out state-of-the-art policy research leading to innovative solutions to the challenges facing Europe today,
- Maintain the highest standards of academic excellence and unqualified independence
- Act as a forum for discussion among all stakeholders in the European policy process, and
- Provide a regular flow of authoritative publications offering policy analysis and recommendations,

Assets

- Multidisciplinary, multinational & multicultural research team of knowledgeable analysts,
- Participation in several research networks, comprising other highly reputable research institutes from throughout Europe, to complement and consolidate CEPS' research expertise and to extend its outreach,
- An extensive membership base of some 132 Corporate Members and 118 Institutional Members, which provide expertise and practical experience and act as a sounding board for the feasibility of CEPS policy proposals.

Programme Structure

In-house Research Programmes

Economic and Social Welfare Policies
Financial Institutions and Markets
Energy and Climate Change
EU Foreign, Security and Neighbourhood Policy
Justice and Home Affairs
Politics and Institutions
Regulatory Affairs
Agricultural and Rural Policy

Independent Research Institutes managed by CEPS

European Capital Markets Institute (ECMI)
European Credit Research Institute (ECRI)

Research Networks organised by CEPS

European Climate Platform (ECP)
European Network for Better Regulation (ENBR)
European Network of Economic Policy
Research Institutes (ENEPRI)
European Policy Institutes Network (EPIN)
