

The Commitment to Development Index (CDI) ranks 22 of the world's richest countries on their dedication to policies that benefit the five billion people living in poorer nations. Moving beyond standard comparisons of foreign aid volumes, the CDI quantifies a range of rich-country policies that affect poor people in developing countries:

- Quantity and quality of foreign aid
- Openness to developing-country exports
- Policies that encourage investment
- Migration policies
- Environmental policies
- Security policies
- Support for creation and dissemination of new technologies

Scores on each component are scaled so that an average score in 2008, the reference year, equals 5.0. A country's final score is the average of those for each component. The CDI adjusts for size in order to compare how well countries are living up to their potential to help.

Commitment to Development Index 2009

Why does the CDI matter? In an increasingly integrated world, rich countries cannot insulate themselves from global poverty and insecurity. Poverty and weak institutions can breed global public health crises, security threats, and economic instability that can destabilize an entire region and send shockwaves around the world. But the Index is also about whether countries are consistent in their values. No human being should be denied the chance to live free of poverty and oppression and to enjoy a basic standard of education and health. The CDI countries, all democracies, preach concern for human life and dignity within their own borders; the Index looks at whether rich countries' actions match their words.

The Bottom Line

Sweden comes in first on the 2009 CDI on the strength of high aid quality and quantity, admission of large numbers of migrants, and low and falling greenhouse gas emissions. Close behind are Denmark, the Netherlands, and Norway, also generous aid donors. New Zealand, Australia, and Spain make it into the top half with a very different profile: generally low on aid but strong on trade, investment, migration, and security. Among the G-7 countries—those that matter most by dint of their economic power—only Canada squeezes into the top half. Japan and South Korea finish last. Like the United States, the two Asian nations have small aid programs for their size. The two also engage less with the developing world in ways measured by the CDI, with tight borders to the entry of goods and people and limited involvement in peacekeeping. Still even the first-place Swedish score only about average (near 5.0) in four of the seven policy areas. All countries could do much more to spread prosperity.

Change, 2003–09

Aid

Foreign aid is the first policy that comes to mind when people think of helping poorer countries. And most comparisons between donors are based only on how much aid each gives. For the CDI, quantity is merely a starting point in a review that also assesses aid quality. The CDI penalizes “tied” aid, which requires recipients to spend aid on products from the donor nation and raises project costs by 15 to 30 percent.

The CDI also favors aid to poor, uncorrupt nations. While aid to Iraq—where corruption is rampant and rule of law weak—is counted at 13¢ on the dollar, aid to Malawi—where poverty is high and governance relatively good—is counted at 94¢ on the dollar. Donors are penalized for overloading countries with too many small aid projects, burdening them with hosting obligations and regular report filing. Finally, the Index rewards governments for letting taxpayers write off charitable contributions, since some of those contributions go to Oxfam, CARE, and other nonprofits working in developing countries.

The dramatic differences between countries in raw aid quantity heavily influence the overall aid scores. The Scandinavian countries and the Netherlands take the top four slots on aid, while Japan and the United States place near the bottom. But quality matters, too. Norway would rank first on sheer aid quantity as a share of GDP, but falls to third for funding smaller projects and being less selective. And the United States would score higher if it did not tie some 26 percent of its aid and if it gave less to corrupt or undemocratic governments in Iraq, Jordan, Pakistan, and elsewhere.

Trade

The system of rules that governs world trade has developed since World War II through a series of major international negotiating “rounds.” Because rich-country players call most of the shots in this intensely political process, some goods that poor countries are best at producing—including crops—still face high barriers in rich countries. Taxes on food imports and subsidies for farmers in rich countries lead to overproduction and dumping on world markets, which lowers prices and hurts poor-country farmers. Industrial tariffs also tend to be anti-poor, with low rates for raw commodities and high rates for labor-intensive, processed goods. And, CDI countries spend almost exactly as much subsidizing their own farmers as they do on aid: some \$106 billion per year. Because access to rich-country markets is crucial for developing countries, the CDI trade component ranks countries according to how open they are to developing-country imports.

Australia does best on trade in the 2009 Index, with New Zealand, the United States, and Canada not far behind. Because EU nations share common trade and agriculture policies, they score essentially the same on trade. Japan’s rice tariffs have shrunk in recent years relative to the rising price of rice, but are still high at 540 percent. Tied for last are Switzerland and South Korea—the former for high tariffs on meat, dairy products, sugar, and wheat from poor countries and the latter for 980 percent tariffs on rice.

Investment

Foreign investment can be a significant driver of development in poor countries. Many of East Asia’s fastest-growing countries—South Korea, Malaysia, Singapore, and Thailand—benefited from investment from abroad. However, foreign investment can also breed instability, corruption, and exploitation.

The CDI rewards countries for policies that promote development-friendly investment. It looks at two kinds of capital flows: foreign direct investment, which occurs when a company from one country buys a stake in an existing company or builds a factory in another country; and portfolio investment, which occurs when foreigners buy securities that are traded on open exchanges. The investment component is built on a checklist. Do the rich-country governments, for example, offer political risk insurance, encouraging companies to invest in poor countries whose political climate would otherwise be deemed too insecure? Do they have tax provisions or treaties to prevent overseas investors from being taxed both at home and in the investment country?

At the bottom of the investment component is Austria, which restricts pension fund investments in developing countries, as well as Ireland and Switzerland, which do not provide political risk insurance through an official national agency. Top-ranked Germany and the UK do better on all these counts and have participated aggressively in international arrangements to control corruption, such as the Kimberley Process to track and eliminate trade in “blood diamonds” that have financed warlords in countries such as Angola and Sierra Leone.

Migration

Some 200 million people today—1 in 33—do not live in the country where they were born. Workers who have migrated from poor to rich countries already send billions of dollars back to their families every year, a flow that surpasses foreign aid. Some immigrants from developing countries, especially students, acquire new knowledge and skills and bring them home.

But what about brain drain? Emigration has been blamed for emptying African clinics of nurses, who can earn far more in London hospitals. But in careful statistical studies, CGD research fellow Michael Clemens has found little evidence that these skilled people hurt their home country by leaving it. Far more ails African clinics and hospitals than a lack of personnel, and personnel shortages themselves result from many forces—such as low pay and poor working conditions—untouched by international migration policies.

Some 200 million people today—1 in 33—do not live in the country where they were born.

The CDI rewards migration of both skilled and unskilled people, though unskilled more so, using data on the gross inflow of migrants from developing countries in a recent year and the net increase in the number of unskilled migrant residents from developing countries

during the 1990s. (Based on census data, this last measure cannot be updated often.) The CDI also uses indicators of openness to students from poor countries and aid for refugees and asylum seekers.

Austria takes first for accepting the most migrants for its size, many from the civil war in Yugoslavia, with Sweden and Spain in second and third place. Near the bottom is Japan, which accepts 250,000 migrants a year from developing countries, a number equal to 0.2 percent of its own population.

Environment

A healthy environment is sometimes dismissed as a luxury for the rich, but no one can live without a healthy environment. The results of climate change are all the more damaging in poor nations, where infrastructures are weak and social services few. A study coauthored by CGD senior fellow David Wheeler predicts that a two-meter sea-level rise would flood 90 million people out of their homes, many of them in the river deltas of Bangladesh, Egypt, and Vietnam.

The environment component looks at what rich countries are doing to reduce their disproportionate exploitation of the global commons. Are they reining in greenhouse gas emissions? Do they subsidize fleets that deplete fisheries off the coasts of Senegal and India?

Norway tops the environment standings. Its net greenhouse gas emissions are among the lowest per capita in the CDI and its gasoline taxes are among the highest. Also near the top is the UK, which has supported wind and other renewable energy sources, and Finland, which significantly reduced its net greenhouse gas emissions rate from 1997 to 2007, the latest data available. Australia finishes low as the biggest emitter of greenhouse gases per capita, as does the United States, the only CDI country that has not ratified the Kyoto Protocol. That gap, along with high greenhouse emissions and low gas taxes, puts the United States third from the bottom.

The results of climate change are all the more damaging in poor nations, where infrastructures are weak and social services few.

Security

Rich nations engage daily in activities that enhance or degrade the security of developing countries. They keep the peace in countries recently torn by conflict and keep vital sea lanes open to international trade. But rich countries also supply developing countries with tanks and jets. The CDI looks at three aspects of the security-development nexus. It tallies the financial and personnel contributions to peacekeeping operations and humanitarian interventions, although it counts only those approved by an international body such as the UN Security Council or NATO. It also rewards countries that base naval fleets where they can secure sea lanes. Finally, the CDI penalizes

some exports of arms, especially to nations that are undemocratic and spend heavily on the military. Putting weapons in the hands of despots can increase repression at home and the temptation to launch military adventures abroad. Money that developing nations spend on weapons might be better spent on teachers or transit systems.

Australia and New Zealand take the top spots on security for their UN-approved action in 1999 to stop Indonesian oppression of East Timor, while Norway comes in third for steady contributions to peacekeeping operations in the former Yugoslavia and the Middle East. The United States scores above average overall for flexing its military muscle near sea lanes and making average contributions to approved international interventions, but loses points for selling arms to Middle Eastern dictatorships such as Saudi Arabia. South Korea earns a perfect score on arms exports to developing countries (it has none) but lags otherwise because of its low international military profile.

Technology

The Internet, mobile phones, vaccines, and high-yielding grains were all invented in rich countries and exported to poorer ones, where they improved—and saved—many lives. Of course, new technologies do harm as well as good: consider the motor vehicle, which symbolizes gridlock and pollution more than it does freedom in dense and growing cities such as Bangkok.

The CDI rewards polices that support the creation and dissemination of innovations of value to developing countries. It rewards government subsidies for research and development (R&D), while discounting military R&D by half. Policies on intellectual property rights (IPRs) that can inhibit the flow of innovations are counted against CDI countries. These take the form of patent laws that arguably go too far in advancing the interests of those who produce innovations at the expense of those who use them. U.S. trade negotiators, for example, have pushed for developing countries to agree not to force the immediate licensing of a patent even when it would serve a compelling public interest, as an HIV/AIDS drug might if produced by low-cost local manufacturers.

The Internet, mobile phones, vaccines, and high-yielding grains were all invented in rich countries and exported to poorer ones, where they improved—and saved—many lives.

Spain finishes first on technology, thanks to R&D subsidies worth more than 1 percent of GDP (and despite devoting much of that to defense). South Korea, whose government R&D spending is also high and whose IPR policies are some of the least restrictive, takes second. The United States loses points for pushing for compulsory licensing bans, and Europeans are penalized for allowing the copyrighting of databases containing data assembled with public funds.

Commitment to Development Index 2009

	Rank	Aid	Trade	Investment	Migration	Environ- ment	Security	Technology	Overall (Average)	Change, 2003–09
Sweden	1	14.3	5.8	5.1	8.3	6.6	4.4	4.4	7.0	+1.0

For More Information

For the details of the 2009 CDI, see “The Commitment to Development Index: 2009 Edition,” by David Roodman, available at www.cgdev.org/cdi. The website has reports on each of the 22 countries in the CDI, as well as graphs, maps, and spreadsheets. The website also has background materials for each policy area: David Roodman on foreign aid, William R. Cline and Roodman on trade, Theodore H. Moran on investment, Elizabeth Grieco and Kimberly A. Hamilton on migration, B. Lindsay Lowell also on migration, Amy Cassara and Daniel Prager on environment,

Michael E. O’Hanlon and Adriana Lins de Albuquerque on security, Jason Alderwick and Mark Stoker also on security, and Keith Maskus on technology.

The research and analysis that underpin this report, and the preparation and publication of this brief and other CDI products, were made possible by support from the Rockefeller Foundation and the CDI Consortium of donor governments.
